Retake

1. When you clone a remote repository, you receive:

0 / 1 point

- ☐ A complete copy, including all branches and their detailed history
- ☒ A read-only version of the repository

This should not be selected

Cloning makes a complete copy by definition

- ☐ A complete copy, including only the most recent commits of each branch

2. To make a compressed tarball of the most current version of your repository, do:

0 / 1 point

- ☐ git archive HEAD | gzip > myproject.tar.gz
- ☐ git archive | gzip > myproject.tar.gz
- ☒ git archive HEAD > myproject.tar.gz

This should not be selected

You need to invoke **gzip**

3. Someone's remote branch could be merged into a certain branch on a repository by using (select all that apply):

0 / 1 point

- ☒ Having the person issue a pull request and then having the maintainer take care of it

Correct

This is a normal method

- ☐ Having the person doing a push if and only if that person has commit privileges for the remote repository

This should be selected

4. A bare repository:

0 / 1 point

- ☐ Is used only for integrity comparison purposes
- ☐ Has no working files and is used only for cloning, fetching and pushing
- ☒ Is naked and thus hidden from public view

This should not be selected

This is a meaningless answer

5. To make a repository on your machine visible to others across the internet using the git protocol you must:

1 / 1 point

- ☐ Configure and enable the httpd service (web server)
- ☒ Configure and enable the git daemon service

Correct

This serves url's beginning with git://
